

# SECTION – B

## TCP/IP:

### Subnet Addressing

# Outline of the talk

- IP Subnet

# IP Subnet

- Basic concept:
  - A subset of a Class A, B or C network.
- IP addresses that do not use subnets consists of
  - A network portion and
  - A host portion
- Represents a static two-level hierarchical addressing model.

# IP Subnet (contd.)

- IP subnets introduces a third level of hierarchy
  - A network portion.
  - A subnet portion.
  - A host portion.
- Allow more efficient (and structured) utilization of the addresses.
- Uses network masks
  - Natural / Default network masks.
  - Custom / Subnet network masks.

# Natural Masks

- Network mask 255.0.0.0 is applied to a class A network 10.0.0.0
  - In binary, the mask is a series of contiguous 1's followed by a series of contiguous 0's.

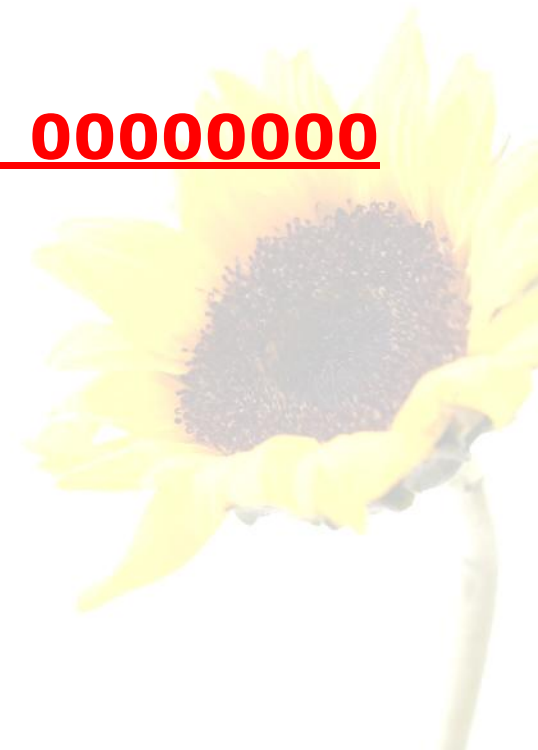

11111111   00000000   00000000   00000000

**Network  
Portion**

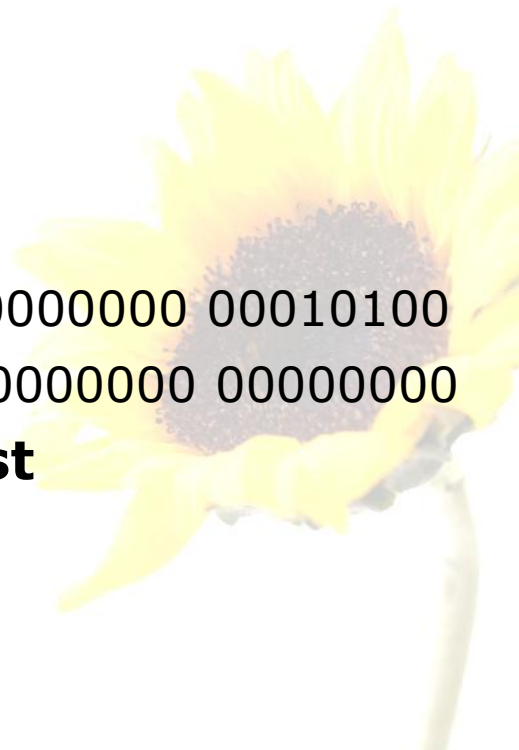

**Host  
portion**

# Natural Masks (contd.)

- Provide a mechanism to split the IP address 10.0.0.20 into
  - A network portion of 10, and
  - A host portion of 20

	<u>Decimal</u>		<u>Binary</u>	
IP address:	10.0.0.20	00001010	00000000 00000000 00010100	
Mask:	255.0.0.0	11111111	00000000 00000000 00000000	
		<b>Network</b>	<b>Host</b>	

# Natural Masks (contd.)

- Class A, B and C addresses
  - Have fixed division of network and host portions.
  - Can be expressed as masks.
    - Called **natural masks**
  - Natural Masks
    - Class A :: 255.0.0.0
    - Class B :: 255.255.0.0
    - Class C :: 255.255.255.0

# Creating Subnets using Masks

- **Masks are very flexible.**
  - Using masks, networks can be divided into smaller subnets.
- **How?**
  - By ending the network portion of the address into the host portion.
- **Advantage gained:**
  - We can create a large number subnets from one network.
  - Can have less number of hosts per network.

# Example: Subnets

- Network mask 255.255.0.0 is applied to a class A network 10.0.0.0
  - This divides the IP address 10.5.0.20 into
    - A network portion of 10.
    - A subnet portion of 5, and
    - A host portion of 20.
  - The 255.255.0.0 mask borrows a portion of the host space, and applies it to the network space,

# Subnets (contd.)

- What happens?
  - We have now split the network into 256 subnets.
  - Initially it was a single large Class A network ( $2^{24} - 2$  hosts).
    - From 10.0.0.0 to 10.255.0.0
    - The hosts per subnet decreases to 65,534

# Subnet (contd.)

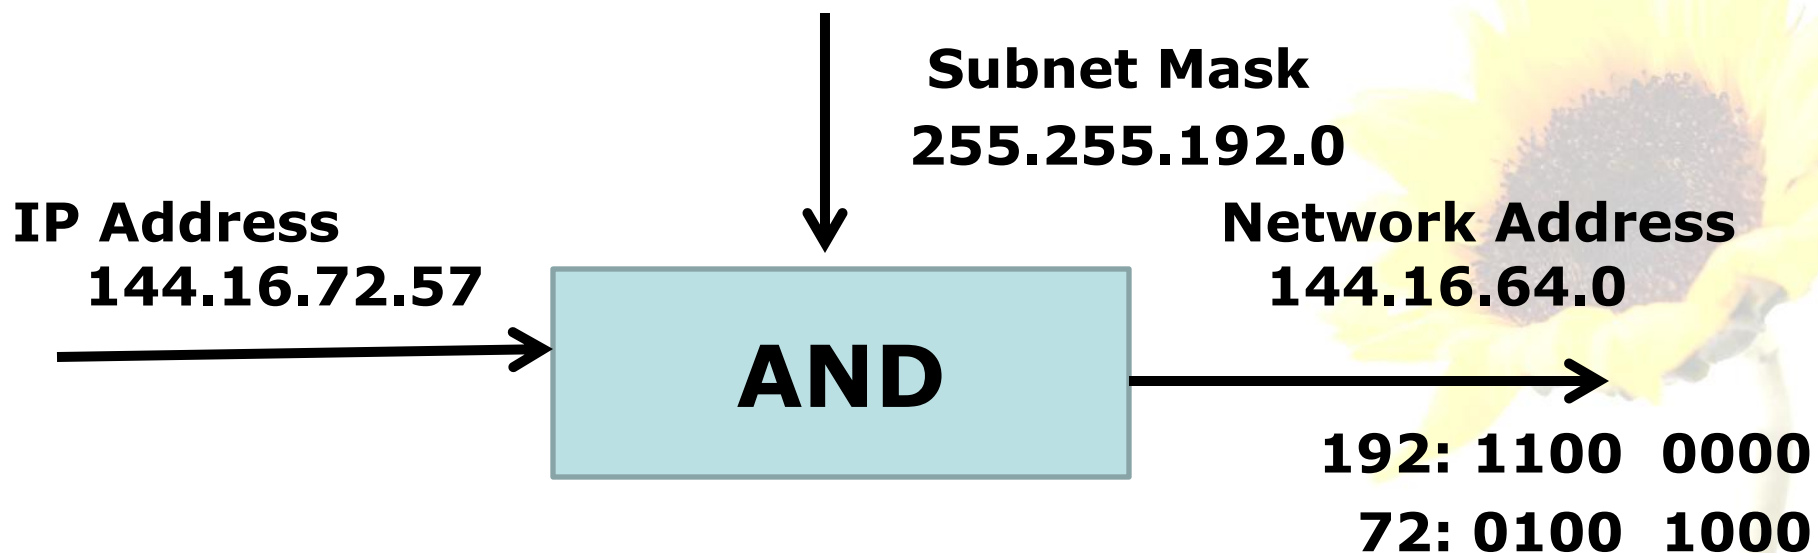

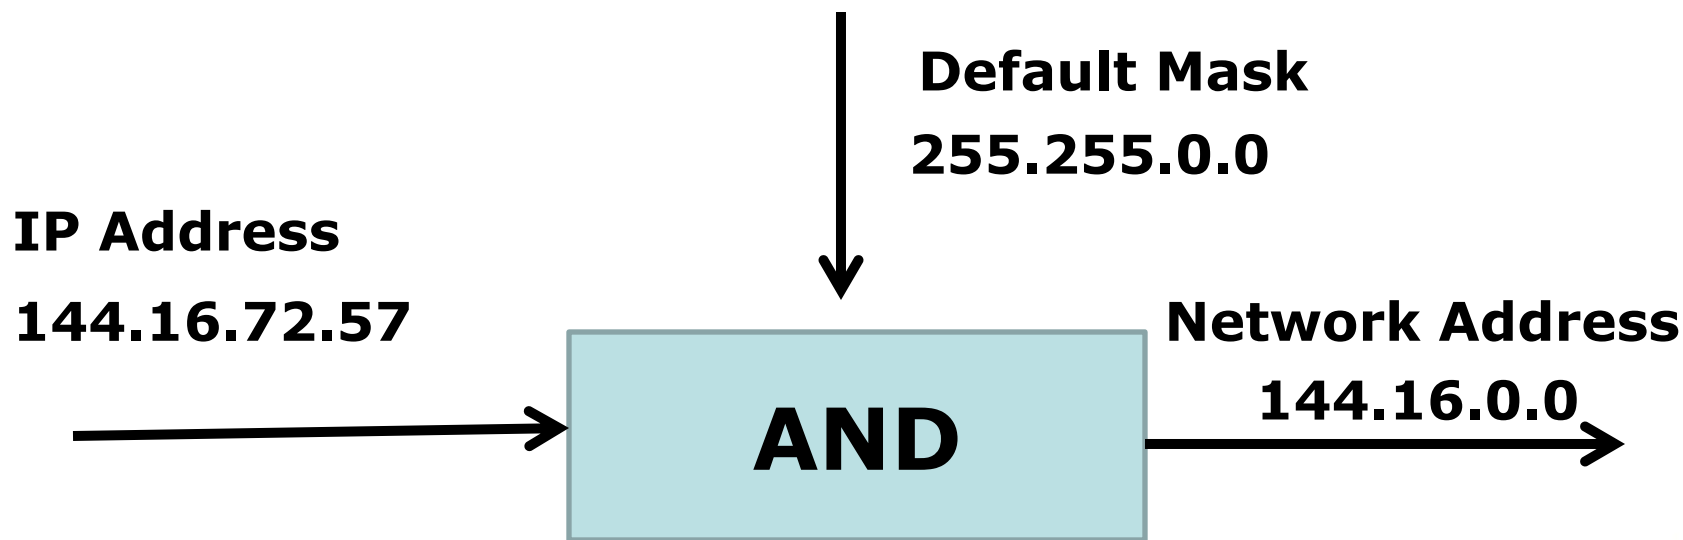

Decimal

Binary

IP address:	10.5.0.20	00001010	00000101	00000000	00010100
Mask:	255.255.0.0	11111111	11111111	00000000	00000000
		<b>Network</b>	<b>Subnet</b>		<b>Host</b>

# Default Mask and Subnet Mask

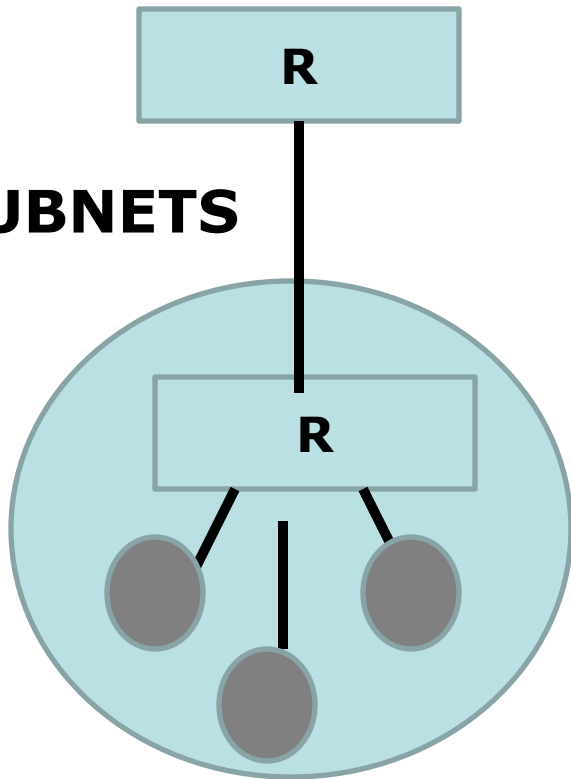

# Subnet vs. Multiple Address Classes

- Subnets
  - Managing of subnets is done by local network administrator
  - Single entry is external router tables.
- Multiple Address Classes
  - Multiple entries in external router tables.
  - Additional overhead on the backbone (external) routers.

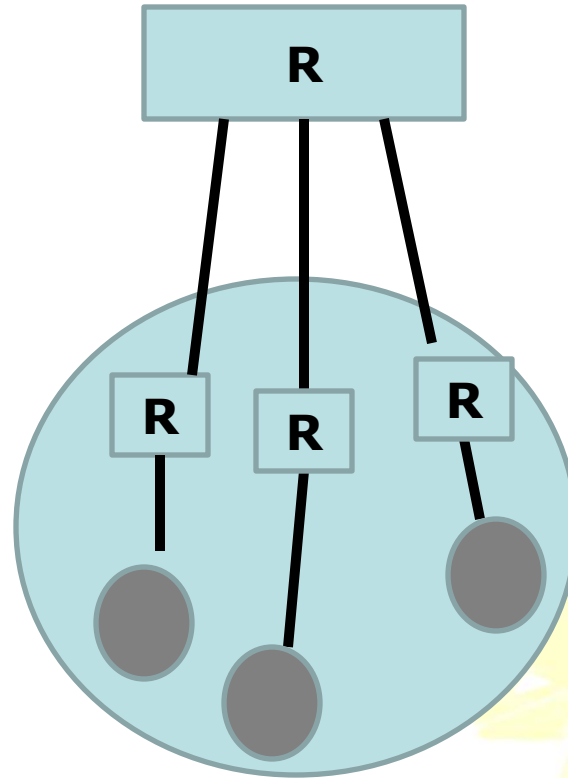

# Comparison

**SUBNETS**

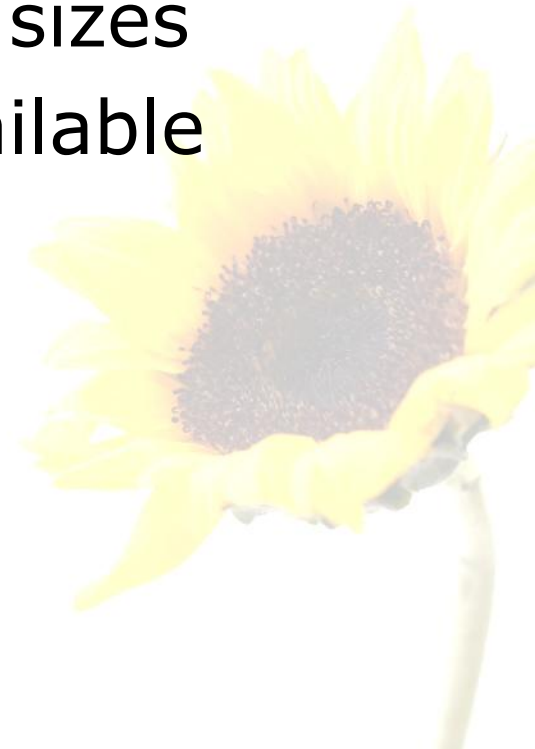

**MULTIPLE  
ADDRESS  
CLASSES**

# Variable Length Subnet Mask (VLSM)

- Basic concept
  - The same network can be configured with different masks.
  - Can have subnets of different sizes
  - Allows better utilization of available addresses.

# Example: VLSM

- Suppose we are assigned a Class C network 192.203.17.0
  - To be divided into three subnets
    - Corresponding to three departments
    - With 110, 45 and 50 hosts respectively.

**D1**  
**(110)**

**D2**  
**(45)**

**D3**  
**(50)**

# The Example (contd.)

- Available subnet options:
  - The network mask will be the Class C natural mask 255.255.255.0
  - Subnet masks of the form 255.255.255.X
    - Can be used to divide the network into more subnets.

# The Subnet Options

<b>X</b>	<b>X (in binary)</b>	<b>No. of Subnets</b>	<b>No of Hosts</b>
<b>128</b>	<b>1000 0000</b>	<b>2</b>	<b>128</b>
<b>192</b>	<b>1100 0000</b>	<b>4</b>	<b>64</b>
<b>224</b>	<b>1110 0000</b>	<b>8</b>	<b>32</b>
<b>240</b>	<b>1111 0000</b>	<b>16</b>	<b>16</b>
<b>248</b>	<b>11111000</b>	<b>32</b>	<b>8</b>
<b>252</b>	<b>1111 1100</b>	<b>64</b>	<b>4</b>

- **Cannot satisfy the requirements (110, 45, 50)**

# The VSLM Option

- **Basic concept:**

- First use the mask 255.255.255.128 to divide the network address into two subnets with 128 hosts each.

- **192.203.17.0 (.0 to .127)**

- **192.203.17.0 (.128 to .255)**

# The VSLM Option (contd.)

**192.203.17.0**

**Mask**

**255.255.255.128**

**192.203.17.0 (.0 to .127)**

**192.203.17.0 (.128 to 255)**

**Mask**

**255.255.255.192**

**192.213.17.128 (.128 to .191)**

**192.213.17.128 (.192 to .255)**

# Running out of IP addresses

- Growing demand for IP addresses
  - Severe strain on the classful model
  - Due to wastage of address space.
- Measures taken:
  - Creative allocation of IP addresses
  - Classless Inter-Domain Routing (CIDR)
  - Private IP addresses, and Network Address Translation (NAT)
  - IP version 6 (IPv6)
